

## Magnifier Tool - Enhancing Accessibility on Windows

The Magnifier Tool is a built-in accessibility feature in Windows that allows users to zoom in on their screen, making it easier to see and read content. This tool is particularly useful for individuals with visual impairments or those who require a larger display.

The Magnifier Tool can be accessed by pressing the Windows key + "+" (plus) to zoom in, and Windows key + "-" (minus) to zoom out. Alternatively, it can be opened by searching for "Magnifier" in the Start menu.

One adjustment made to align the Magnifier Tool with the Windows environment is the integration with other accessibility features. For example, users can enable high contrast mode alongside the Magnifier Tool to improve visibility further. Additionally, the Magnifier Tool can be customized to follow the mouse cursor or keyboard focus, allowing for a more dynamic and user-friendly experience.

### Examples:

1. To open the Magnifier Tool, press the Windows key and search for "Magnifier" in the Start menu. Click on the Magnifier app to launch it.
2. Once the Magnifier Tool is open, use the Windows key + "+" (plus) to zoom in and Windows key + "-" (minus) to zoom out. The zoom level can also be adjusted using the slider in the Magnifier window.
3. To customize the Magnifier Tool, click on the gear icon in the Magnifier window. Here, users can choose different zoom modes, such as full screen, lens, or docked. They can also adjust the zoom level, follow the mouse cursor, or enable high contrast mode.
